The Turing Test (Stanford Encyclopedia of Philosophy)

To avoid prejudicial rejection of evidence of machine intelligence, Turing suggested the "imitation game," now known as the Turing test: a remote human interrogator, within a fixed time frame, must distinguish between a computer and a human subject based on their replies to various questions posed by the interrogator. By means of a series of such tests, a computer's success at "thinking" can be measured by its probability of being misidentified as the human subject.

Turing Test

The Turing test, developed by Alan Turing in 1950, is a test of a machine's ability to exhibit intelligent behaviour

equivalent to, or indistinguishable from, that of a human. Turing proposed that a human evaluator would judge natural language conversations between a human and a machine designed to generate human-like responses. The evaluator would be aware that one of the two partners in ...
